

How I Work — Method One-Pager

VigilLine · Healthcare Competitive Intelligence · public sources only

A sample of this method's output: [01-landscape-sample/daraxonrasib-landscape-PUBLIC.pdf](#) — a 10-section, 25-source competitive landscape built entirely from public information.

The six steps

#	Step	What happens
1	Continuous monitoring	A daily automated scan across regulatory publications, trial registries, peer-reviewed journals, conference abstracts, and company disclosures — running whether or not there is an active engagement.
2	Triage	What changed, what is material, what is noise. Most announcements do not move a competitive position; the job is finding the ones that do.
3	Analysis	Trial-level detail: endpoints, hazard ratios, subgroup behaviour, safety, mechanism differentiation. Not a summary of the press release — a read of the underlying data.
4	Synthesis	What it means for your positioning. This is the part that cannot be automated: judgement about consequence.
5	Delivery	Decision-ready format — executive summary first, evidence below, every material claim cited. Written for a senior reader with ten minutes.
6	Quality audit	Every deliverable is checked against a 34-pattern audit for AI-generated filler — the generic hedging, unsourced assertion, and structural padding that has flooded research output since 2024.

Why continuous monitoring matters

	Typical research engagement	This method
Starting point	Kick-off call, then begin scanning	Already monitoring
Time to first draft	3–6 weeks	2–3 weeks
Cost of a refresh	Nearly the cost of the original	Minimal — the increment is small
Staleness	Begins the day it is delivered	Refreshed on a schedule

The pipeline runs continuously. A landscape is a snapshot of something already being watched, not a project that starts from zero.

What I will and will not do

✔ I work from	✗ I will not use
Regulatory approvals, labels, review documents	Non-public or confidential information
Trial registries (ClinicalTrials.gov, CTRI, EU CTR)	Insider or "off the record" disclosure
Peer-reviewed publications	Pretexting or misrepresentation
Conference abstracts and presentations	Anyone's confidential documents
Company disclosures, filings, IR materials	Employer-derived content of any kind
Reputable trade and industry press	Primary research or expert interviews (not offered)

If someone offers me non-public information, I stop them. Once heard, it cannot be used, and it contaminates the engagement. This is stated in every deliverable and in every statement of work.

What you receive

Element	Detail
Format	PDF plus an editable document
Structure	Executive summary first, then evidence, then strategic implications
Sourcing	Numbered citations throughout; every material claim traceable
Revisions	Two rounds included within the agreed scope
Turnaround	2–3 weeks for a landscape; 1–2 weeks for a battlecard set
Refresh	Available monthly or quarterly on a retainer basis

The sources-and-method statement

Every deliverable carries this footer:

This analysis was prepared exclusively from publicly available information. No non-public, confidential, or employer-derived information was used or solicited in the preparation of this analysis. Every material claim is sourced.

This is not boilerplate. It is what lets a compliance team approve a vendor without a second meeting — and it is a differentiator in a market where most research output cites nothing at all.
